WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or longer, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all traumatisms other than battle casualties (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications as well as various types of wounds not due to enemy action). Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease." The presence of Ports of Embarkation and of large numbers of casualties admitted should be borne in mind in making comparisons between Service Commands and individual stations.

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. This ratio may not be significant when the strength of a Command is changing markedly or when a Command has a relatively large number of General Hospitals.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

EXPLANATORY MATTER

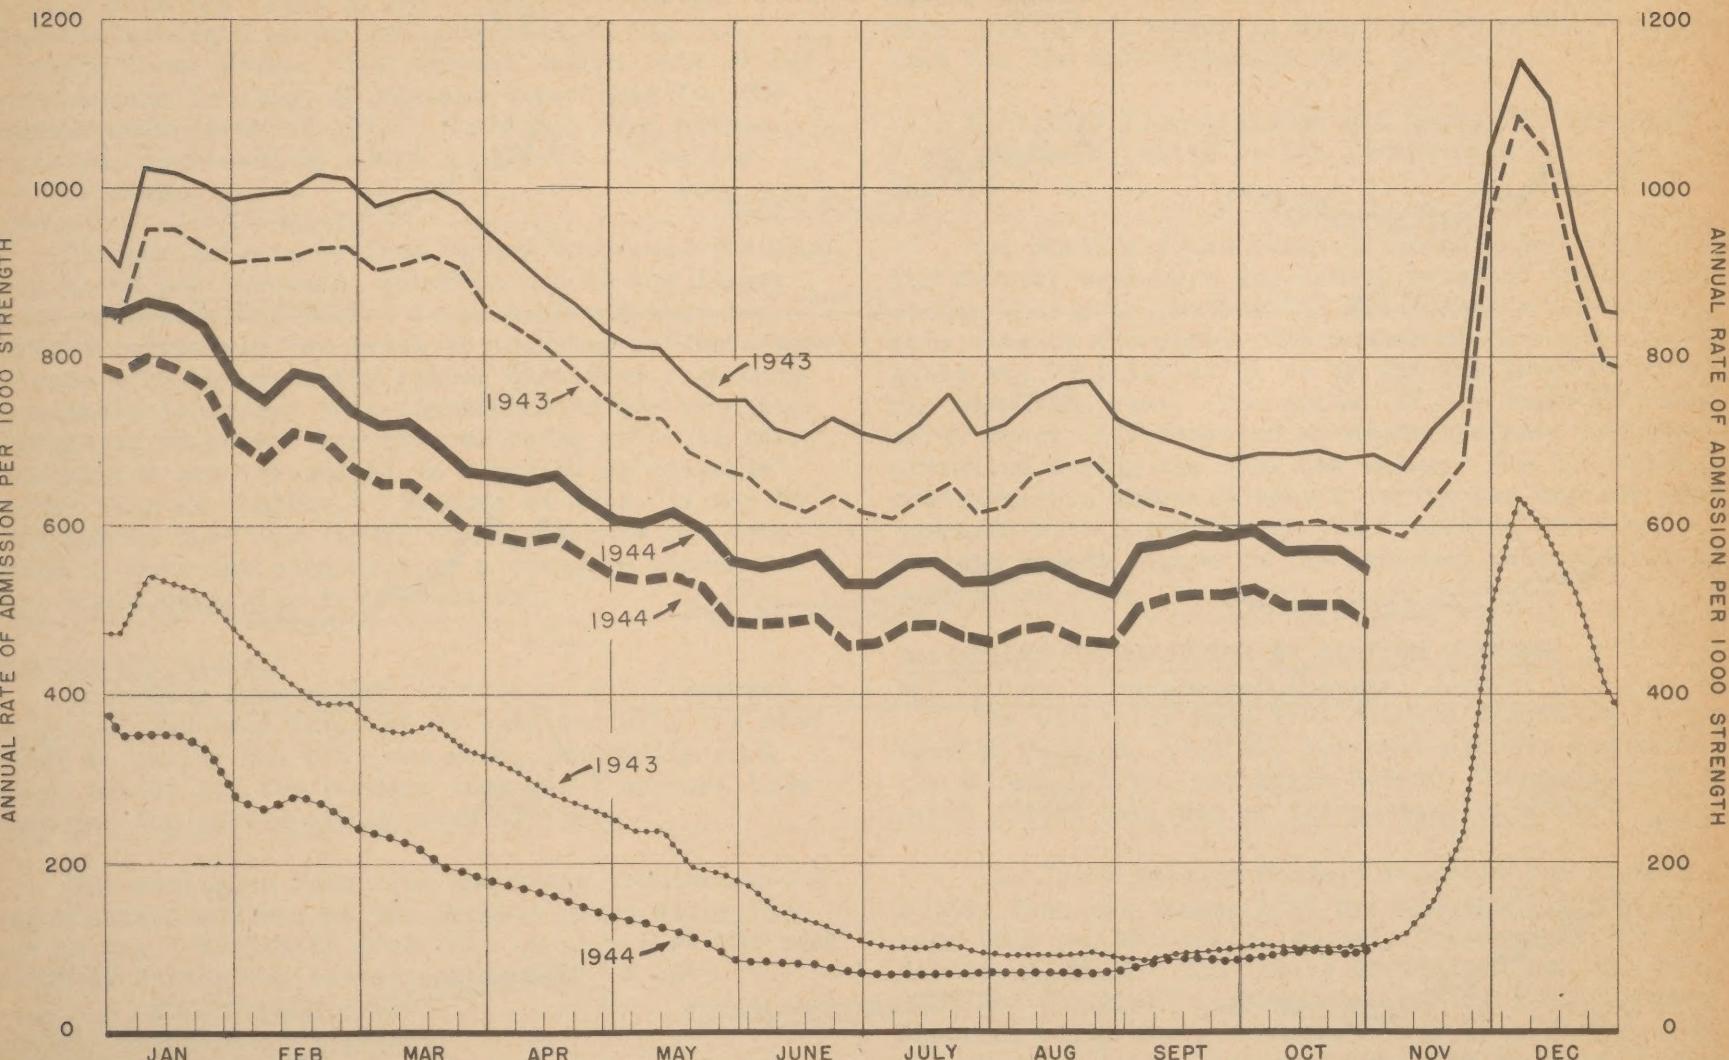

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

During the week ending 3 November 1944 the admission rate from all causes decreased by almost 5 percent from the level of about 570 per year per thousand strength which had prevailed during the previous three weeks. The current week's rate of 548 per thousand is about 20 percent lower than for the corresponding week of 1943. Morbidity from disease, likewise, decreased by about 5 percent during the current week.

The admission rate from injury increased fractionally to 64 per thousand, which is one of the lowest rates recorded this year. It is believed that the current relatively low level of injuries reflects compliance with the recently issued directive regarding reportable injuries; this clarification provided that readmitted cases and injuries existing prior to entry into active service should be reported as "disease" rather than as "injury." Because of this, it may be anticipated that the injury admission rate for some weeks to come may show more of a downward tendency than would otherwise have prevailed.

Respiratory Causes:

Morbidity from colds, influenza, etc. reported at 93 per thousand remained at substantially the same level as during the previous week. Morbidity from these causes for the current week was 7 percent lower than for the corresponding week of 1943.

The admission rate from pneumonia remained at 10 per thousand and was at the highest point since the end of May. Morbidity from this cause was at the same level as during the corresponding week of 1943.

Common Communicable Diseases:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service decreased from 41 per thousand to 38 per thousand for the current

week. This decline follows the trend observed in previous months when a sharp drop was always noted in the first week of the month as compared with the last week of the previous month, followed by a gradual increase during the remaining weeks of the month. The admission rate from these causes is more than 45 percent higher than for the corresponding week of 1943.

Morbidity from diarrhea and dysentery remained at 7 per thousand, which is the lowest rate reported since the end of April.

The numbers of new cases of measles and mumps during the current week were the lowest reported for any week so far this year, reflecting the normal situation at this time of the year. The number of new cases of meningitis was reported at 11 or by far the lowest number of any week this year. The number of new cases of rheumatic fever (57) remained at about the same level as has prevailed during the past ten weeks. The new cases of poliomyelitis numbered only 2 during the current week as compared with 5 and 12 for the preceding two weeks; the current week's figure is the smallest recorded for any week since June.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

All Causes: Disease and Injury:

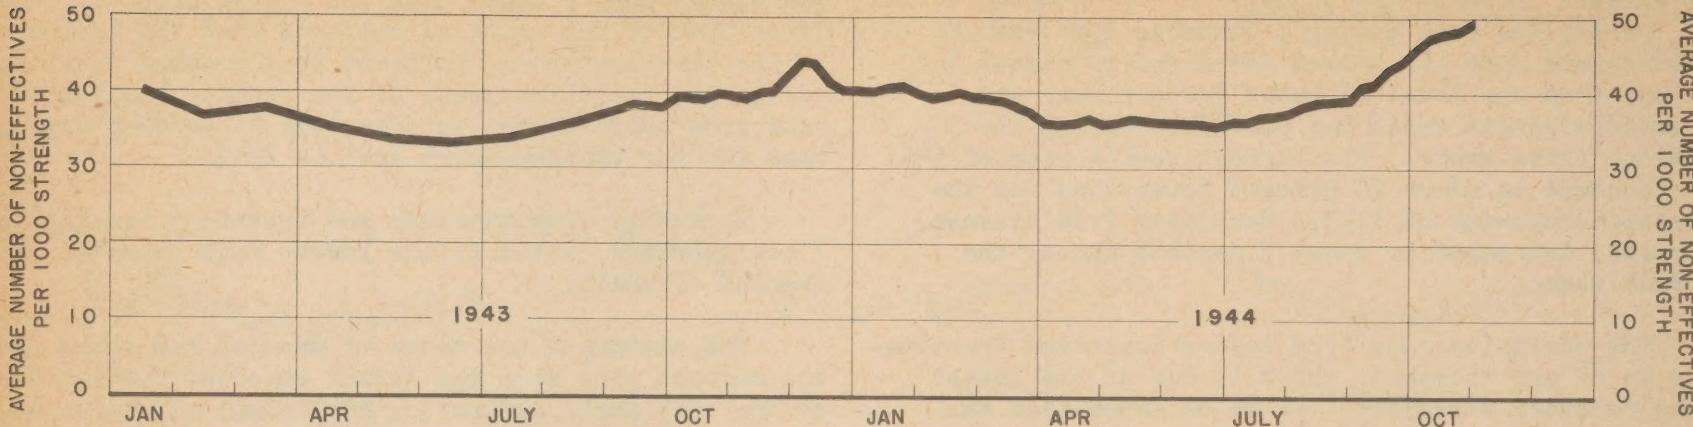

The admission rate from disease decreased in every Service Command, with the greatest changes occurring in the Second, Fifth, and Sixth Service Commands, all of which showed declines of ten percent or more.

The Third Service Command reported the highest morbidity from all causes (665 per thousand) and from disease (618 per thousand), closely followed by the Second Service Command. The lowest morbidity from all causes (503 per thousand) was reported by the Fifth Service Command, while the lowest morbidity from disease (442 per thousand) was again registered in the Eighth Service Command, which has continued to report very low morbidity in recent months.

COMMENT ON CURRENT TRENDS (CONT'D)

An increase of more than 20 percent in morbidity from injury was reported by the Fourth Service Command, chiefly because of higher admissions at a number of large stations. Only the Eighth Service Command reported significantly lower morbidity from injury. The Fourth Service Command, with a rate of 77 per thousand, was the only Command to report morbidity from this cause in excess of 65 per thousand.

Respiratory Causes:

The admission rate from colds, influenza, etc. decreased sharply (by 15 percent or more) in the First, Second, and Seventh Service Commands. However, moderate increases were reported by the majority of the other Service Commands.

The Military District of Washington reported the highest morbidity from colds, influenza, etc. (119 per thousand) closely followed by the Second and Third Service Commands. The Seventh Service Command reported the lowest morbidity from these causes (76 per thousand).

Morbidity from pneumonia remained about the same in most Service Commands. However, a significant increase did occur in the Eighth Service Command. The Sixth Service Command, with a rate of 19 per thousand, or almost double that for the country as a whole, reported the highest morbidity from this cause.

Common Communicable Diseases:

Morbidity from "new" venereal (excluding EPST) cases decreased in the majority of the Service Commands; only the Third Service Command and the Military District of Washington showed other than fractional increases. The greatest decreases were reported by the First, Sixth, Seventh, and Eighth Service Commands. The Third Service Command reported the highest morbidity from these causes (62 per thousand), followed by the Second and Fifth Service Commands with rates of

about 51 per thousand. The high experience of the Second Service Command is due to the presence of task force troops not under its jurisdiction.

All Service Commands reported relatively low morbidity from diarrhea and dysentery. For the first time in many weeks no Service Command reported morbidity from this cause in excess of 10 per thousand.

NON-EFFECTIVE RATE:

The non-effective rate increased for the sixteenth consecutive week to 49.5 per thousand; this is the highest rate recorded during this war. More than 25 percent of the current non-effective rate arises from days of treatment for cases evacuated from overseas theaters. The non-effective rate for personnel stationed in this country is estimated to be lower than in 1943.

PATIENTS REMAINING UNDER TREATMENT, 3 November 1944:

The number of neuropsychiatric cases remaining was reported at 19,988 or about 100 more than for the previous week. The number of non-battle injury patients remaining totaled about 31,000. The number of battle casualty patients remaining increased by about 1,900 to number 26,020.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 3 November there were 4,906 enlisted men discharged by CDD or about 100 more than the previous week. About 47 percent of these discharges were reported by General Hospitals. Included among the 4,906 CDD's were 1,827 neuropsychiatric cases, as compared with 1,705 such cases among the previous week's CDD's.

SUPPLEMENTARY HEALTH REPORT

CONVALESCENT AND RECONDITIONING PROGRAM DATA

Under the provisions of paragraph 36r, AR 40-1080, Changes No. 2, the numbers of Class 1, Class 2, Class 3, and Class 4 patients discharged for disability, returned to duty, and remaining in convalescent and reconditioning programs are required to be reported weekly in the Statistical Health Report (Form 86ab). Class 1 patients are those nearest to recovery and able to engage in fairly strenuous physical activities, Class 2 patients are in the same category but not as advanced, Class 3 are ambulant patients under treatment, and Class 4 are bedridden patients.

As of 27 October 1944, the number of patients remaining in hospital (and convalescent facilities) at stations reporting on the convalescent and reconditioning program represented 98 percent of all Army patients in hospital in the continental U.S. The remaining 2 percent are accounted for in part by certain hospitals which had too few patients to institute such programs (e.g. Prisoners of War Camps and installations with small numbers of U.S. Army patients). As of the end of October, practically all large stations throughout the country were reporting such data, except for several Transportation Corps hospitals which had not set up reconditioning programs.

In this report there are listed separately by Service Command the following data for each General Hospital, each other ASF hospital, and each AAF hospital:

- (1) the total Army patients remaining at the end of the period (27 October 1944).
- (2) the total number discharged with Certificate of Disability for Discharge (CDD) during the four-week period ending 27 October.
- (3) the number returned to duty during this period.

The number of Class 1, Class 2, Class 3, and Class 4 patients as well as the total number in the reconditioning program are shown for each station. It should be noted that the reconditioning programs are generally in effect throughout the hospital and are not confined to the convalescent facilities in those stations that have both hospital beds and convalescent facilities beds.

For the total United States, 74 percent of the total patients remaining in hospital as of 27 October were participating in the reconditioning program as compared with 72 percent as of the end of September. In General Hospitals, which accounted for almost 50 percent of the total patients, the corresponding proportion as of the end of October was somewhat higher (75 percent), while for other ASF hospitals and AAF hospitals, the figures were 68 percent and 83 percent respectively. There was a definite increase in the proportion participating at AAF hospitals and ASF hospitals other than General Hospitals between the end of September and the end of October.

The proportion of total patients participating in the reconditioning program varied considerably by Service Command. The highest proportion (89 percent) was again reported in the Second Service Command followed by the Seventh and Ninth Service Commands (with about 82 percent). On the other hand, the lowest proportion was registered in the Eighth Service Command where only 63 percent of the patients remaining were in the reconditioning program. Both the Fourth and the Eighth Service Commands showed notable rises in the proportion participating in October.

CONVALESCENT AND RECONDITIONING PROGRAM DATA (CONT'D)

For the United States as a whole, the patients remaining in the reconditioning program were subdivided as follows:

	<u>Total</u>	<u>Class 1</u>	<u>Class 2</u>	<u>Class 3</u>	<u>Class 4</u>
Total U.S.	100%	9%	14%	47%	30%
Gen. Hosp.	100	3	11	56	30
Other ASF	100	8	17	43	32
AAF Hosp.	100	22	20	28	30

From the above it will be noted that General Hospitals tended to have more patients in Class 3 and somewhat fewer patients in the other classes (particularly Class 1) than was the case for all hospitals in the country. The other ASF hospitals had relatively fewer patients in Class 3, while for AAF hospitals there were decidedly more patients in Classes 1 and 2 and considerably fewer in Class 3. This may reflect, to some extent, differences in classification of patients as between AAF and other hospitals, since many of the former had reconditioning programs some time before such were instituted on an Army-wide basis. All three types of hospitals showed about the same proportions in Class 4. It is noteworthy that these distributions are almost identical with the corresponding ones at the end of September.

The distribution of patients remaining by class varied considerably by Service Command. The highest proportion of Class 4 patients was again reported by the Sixth Service Command (40 percent), with no other Service Command having a figure in excess of 32 percent; the lowest proportion of Class 4 patients was again shown by the First Service Command (25 percent). In respect to Class 3 patients, the highest proportion was again reported by the First Service Command (66 percent), while the Fourth and Eighth Service Commands

had the lowest proportion (39 percent).

The highest proportion of Class 2 patients was recorded in the Third Service Command (20 percent), while the lowest was in the First Service Command (4 percent). In respect to Class 1 patients, both the Fourth and Eighth Service Commands showed the highest proportion (about 14 percent), while the lowest was in the Second, Third, Fifth and Sixth Service Commands (about 4 percent).

Patients returned to duty from the reconditioning program quite naturally came primarily from Classes 1 and 2. The distribution by class was as follows: Class 1—37 percent, Class 2—22 percent, Class 3—32 percent, and Class 4—9 percent. This distribution for October is almost identical with that for the previous month. These proportions differed considerably as between General Hospitals, other ASF Hospitals, and AAF Hospitals. Thus, General Hospitals showed an unusually high proportion returned to duty from Class 3 (45 percent), while AAF hospitals showed a relatively large proportion returned to duty from Classes 1 and 2 (50 and 30 percent respectively). General Hospitals showed 51 percent returned to duty from Classes 1 and 2 combined, while other ASF hospitals showed only 43 percent from these two classes but reported an unusually high proportion returned to duty from Class 4 (12 percent).

Of the patients in the reconditioning program who were discharged with CDD's during the four-week period ending 27 October, 70 percent were from Class 3 (as contrasted with 71 percent in September; the remaining 30 percent were subdivided as follows: Class 4—11 percent, Class 2—14 percent, and Class 1—5 percent. In General Hospitals, where more than half of the CDD's were reported, 75 percent of those discharged were from Class 3 and only 14 percent from Classes 1 and 2 combined.
